

Performance Testing

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Objective

To verify that the automated laptop order flow runs correctly, quickly and reliably, and stays stable when many requests are submitted at the same time.

2. Test Scenarios

No.	Scenario	Expected Result
1	Submit a standard laptop request	Flow triggers automatically and approval is sent to the manager
2	Manager approves the request	Procurement task is created and assigned to IT Procurement group
3	Manager rejects the request	Request is closed and the requester is notified
4	Requested model is out of stock / non-standard	Request is routed for manual review with a notification
5	Task is completed by IT Procurement	Request moves to Closed Complete and delivery email is sent
6	Multiple requests submitted together	Each request runs its own flow without delay or data mix-up

3. Performance Parameters

Parameter	Target
Flow trigger time after submission	Within a few seconds
Approval and task creation	Immediately after the decision
Notification delivery	Within 1 minute of each status change
Concurrent requests	Flow handles simultaneous requests without failure
Failed flow executions	0 in the test run (checked in Flow Execution details)

4. Testing Method

Testing was done in Flow Designer using the Test option and by submitting real catalog requests. Execution time and status of every step were checked in the flow execution history.

5. Conclusion

The flow met the expected behaviour in all scenarios, with no failed executions and correct routing for approved, rejected and exception cases.
