

Customer Journey Map

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Phase: 2. Requirement Analysis

This map follows an employee (requester) from identifying an IT need to receiving the item, and shows how the Flow Designer automation removes today's manual pain points.

Stage	1. Identify Need	2. Raise Request	3. Approval	4. Procurement	5. Delivery & Asset Update	6. Closure & Feedback
User actions	Notifies a new laptop, software licence or server is required.	Opens Service Portal, selects IT Procurement catalog item, fills quantity, cost centre, justification.	Manager and (above threshold) Finance review the request and approve or reject.	Procurement team validates, picks vendor, raises Purchase Order.	Item is received, serial number recorded, handed to requester.	Requester confirms receipt and rates the experience.
Touchpoints	Email, chat with manager, Service Portal	Service Portal, Catalog form, Record Producer	Approval email, ServiceNow mobile, Approval inbox	Procurement workspace, PO records, vendor email	Asset records, CMDB, delivery note	Survey, notification email
Emotions	Neutral / Unsure who to ask	Frustrated by long forms and unclear process	Anxious, waiting with no visibility	Uncertain about status	Relieved when item arrives	Satisfied if the process was quick
Pain points (today)	No single place to raise needs; unclear policy.	Emails and spreadsheets; missing details cause rework.	Approvals lost in inboxes; no reminders or escalation.	Manual PO creation; duplicate data entry; budget not checked.	Assets not updated; delays in tracking.	No feedback loop; no audit trail.
Opportunities (with Flow Designer)	Guided catalog with policy hints.	Single validated catalog form; auto-populated user and department data.	Auto-routing by cost threshold; reminders and auto-escalation.	Auto-create PO / procurement task with request data; budget check.	Auto-create asset record; notify requester.	Auto-close request and send satisfaction survey.

Experience Summary

Metric	Before automation	After automation (target)
Request to approval	2 to 5 days (manual follow-up)	Under 1 day (auto-routing and reminders)
PO creation effort	Manual re-entry of request data	Automatic, zero re-entry
Status visibility	Ask by email or phone	Real-time in portal with notifications
Audit trail	Scattered across emails	Complete, in the request record
