

Solution Requirements

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Phase: 2. Requirement Analysis

This document lists what the IT Procurement automation must do (functional) and how well it must do it (non-functional).

1. Functional Requirements

ID	Requirement	Priority
FR-01	Provide a Service Catalog item / Record Producer to raise IT procurement requests (item type, quantity, estimated cost, cost centre, justification, needed-by date).	High
FR-02	Validate mandatory fields and auto-populate requester, department and manager.	High
FR-03	Trigger a Flow Designer flow when a request is submitted.	High
FR-04	Route approval to the requester's manager; add Finance approval when cost exceeds the configured threshold (system property).	High
FR-05	Send reminders for pending approvals and escalate after the defined SLA.	Medium
FR-06	On approval, create a procurement task / Purchase Order with request data mapped automatically.	High
FR-07	On rejection, close the request with comments and notify the requester.	High
FR-08	Create asset records when items are received and update request state.	Medium
FR-09	Send email and portal notifications at each key stage.	High
FR-10	Log errors and notify administrators if any flow action fails.	Medium
FR-11	Provide dashboards and reports for pending requests, spend and cycle time.	Low

2. Non-Functional Requirements

Category	Requirement
Performance	Flow starts within 5 seconds of submission; notifications sent within 1 minute.
Security	Role-based access (Requester, Manager, Finance, Procurement, Admin); ACLs on procurement tables.
Reliability	Flow errors are captured with retry or an admin alert; no lost requests.
Usability	Form completed in under 3 minutes; works on desktop and mobile portal.
Auditability	Every approval, state change and comment is stored with user and timestamp.
Maintainability	Approval thresholds and email templates configurable without code changes.
Scalability	Handles at least 500 requests per month without redesign.

3. Roles and Access

Role	Responsibility
Requester	Raise and track requests
Manager	First-level approval
Finance Approver	Approve requests above threshold
Procurement Officer	Create PO, manage vendor, receive items
Administrator	Maintain flow, thresholds and notifications

4. Assumptions and Constraints

- A ServiceNow instance (Personal Developer Instance) with Service Catalog, Flow Designer and Procurement plugins is available.
- Vendor integration is out of scope; POs are created inside ServiceNow.
- Approval threshold value is set through a system property and agreed with Finance.
