

Technology Stack

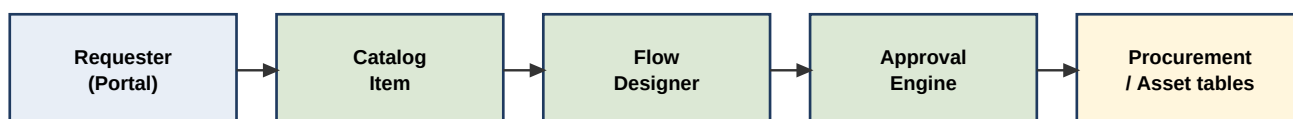

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Phase: 2. Requirement Analysis

This document lists the platform, tools and components used to build and deliver the IT Procurement automation.

Layer	Technology / Component	Purpose
Platform	ServiceNow (Personal Developer Instance)	Low-code enterprise workflow platform hosting the solution
Automation	Flow Designer (Flows, Subflows, Actions)	Orchestrates request, approval, PO creation and notification logic
Request intake	Service Catalog, Catalog Item / Record Producer, Variables	Structured form for raising procurement requests
User interface	Service Portal / Employee Center	Portal for requesters to submit and track
Approvals	Flow Designer 'Ask for Approval' action, Approval Engine	Manager and Finance approvals
Data	sc_request, sc_req_item, sysapproval_approver, proc_po, alm_hardware	Stores requests, approvals, POs and assets
Notifications	Notification and Email Templates, Inbound/Outbound Email	Alerts at each stage
Configuration	System Properties, Business Rules (minimal), Client Scripts	Thresholds and form behaviour
Reporting	Reports, Dashboards, Performance Analytics	Spend and cycle-time visibility
Security	Roles, ACLs, Groups	Role-based access
Testing	Flow Designer Test tool, Automated Test Framework (ATF)	Verify flows and scenarios
Source control	GitHub repository with project template	Documentation and update-set storage
Migration	Update Sets	Move changes between instances

Architecture Overview

Notifications and reports run alongside every stage
