Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Introduction

IT teams spend a lot of time handling standard laptop requests manually: routing approvals, creating tasks and sending updates. This project automates the whole process using ServiceNow Flow Designer.

2. Problem Statement

Manual handling of laptop orders causes delays, missed follow-ups and inconsistent approvals. Employees have no clear visibility of request status.

3. Objectives

Automate standard laptop ordering end to end; reduce approval and fulfilment time; give requesters automatic status updates; keep the process consistent and reusable.

4. Solution Overview

A Service Catalog item captures the request. A Flow Designer flow then handles manager approval, creates the procurement task, updates the request state and sends notifications until the order is closed.

5. Technology Stack

Area	Technology
Platform	ServiceNow
Automation	Flow Designer (flows, subflows, actions)
Request intake	Service Catalog
Approvals	ServiceNow Approval Engine
Communication	Email notifications

6. Roles

Requester (submits request), Manager (approves), IT Procurement (fulfils order), Admin (maintains the flow).

7. Conclusion

The automated flow removes manual routing, speeds up laptop delivery and gives a clear, repeatable process that can be extended to other hardware requests.
