

Code Layout, Readability and Reusability

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Code Layout

The solution is built on the ServiceNow platform using low-code Flow Designer. The logic is organised into one main flow and several reusable subflows/actions, so each piece has a single clear purpose.

Component	Purpose
Catalog Item: Standard Laptop	Request form with laptop model, justification and delivery location variables
Main Flow: Standard Laptop Order	Triggered on request submission; controls approval, ordering and fulfilment
Subflow: Manager Approval	Requests approval from the requester's manager and returns the decision
Subflow: Create Procurement Task	Creates the purchase / fulfilment task for the IT procurement group
Action: Send Notification	Sends status emails to the requester and approver

2. Readability

Every flow, subflow, action and variable uses a clear descriptive name (for example, *Laptop_Manager_Approval*). Each step has a short annotation describing what it does. Flow logic is kept linear with minimal nesting, so anyone can read it from top to bottom in Flow Designer without extra documentation.

3. Reusability

Common steps such as approval, notification and task creation are built as subflows and actions. They can be reused for other standard hardware requests (monitor, keyboard, mobile) by changing only the inputs. Values such as approval groups and SLA durations are stored as properties or catalog variables instead of being hard-coded, which keeps maintenance simple.

4. Best Practices Followed

Consistent naming convention; one purpose per subflow; error handling and fallback notification paths; testing in a sub-production instance before promotion; changes captured in an update set.
