

Coding & Solution

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Solution Overview

Standard laptop orders are automated end to end with Flow Designer. A request submitted through the Service Catalog runs through approval and fulfilment automatically, with no manual routing by the IT team.

2. Implementation Steps

Step	Description
1	Create the catalog item Standard Laptop with variables: model, business justification, delivery location
2	Create the flow Standard Laptop Order with trigger: Service Catalog (item request submitted)
3	Add action: Ask for Approval (requester's manager); on rejection, update the request to Closed and notify the requester
4	On approval, add action: Create Catalog Task assigned to the IT Procurement group
5	Add action: Update Request state to In Progress and send notification to the requester
6	When the task is completed, update the request to Closed Complete and send the delivery confirmation
7	Test with valid, rejected and out-of-stock scenarios, then activate the flow

3. Flow Logic (Summary)

Trigger (request submitted) → **Approval** (manager) → **If approved:** create procurement task → notify requester → task completed → close request. **If rejected:** close request → notify requester.

4. Outcome

Manual routing and follow-ups are removed, approval and fulfilment happen in a predictable sequence, and requesters receive status updates at every stage.
